TYPESCRIPT FOR PRODUCTION TEAMS

Migration worksheet

Step 1 - Baseline

Turn on `allowJs` and `checkJs: false`. Add `// @ts-check` to one leaf module and fix it.

Commit. This is the only step that must land before anything else.

Step 2 - Boundary types

Type the edges first: HTTP clients, database rows, third-party payloads.

Do not type internals yet - they will fall out of the boundaries.

Step 3 - Rename and fix

Rename one file per pull request. Keep the diff under 300 lines.

Ban `any` in review with a comment: `// eslint-disable-next-line` is a red flag, not a fix.

Step 4 - Turn up strictness

Enable strictNullChecks. Fix. Then noImplicitAny. Fix. Ship each step separately.

Step 5 - Keep it strict

Add `tsc --noEmit` to CI. A migration that CI does not enforce is already reverting.
